

Asymmetric Total Synthesis of (+)-Waihoensene

Yongzheng Qu, Zheyuan Wang, Zhongchao Zhang, Wendou Zhang, Jun Huang*, and Zhen Yang*

a) Total synthesis of (\pm)-waihoensene by Lee and co-workers in 2017

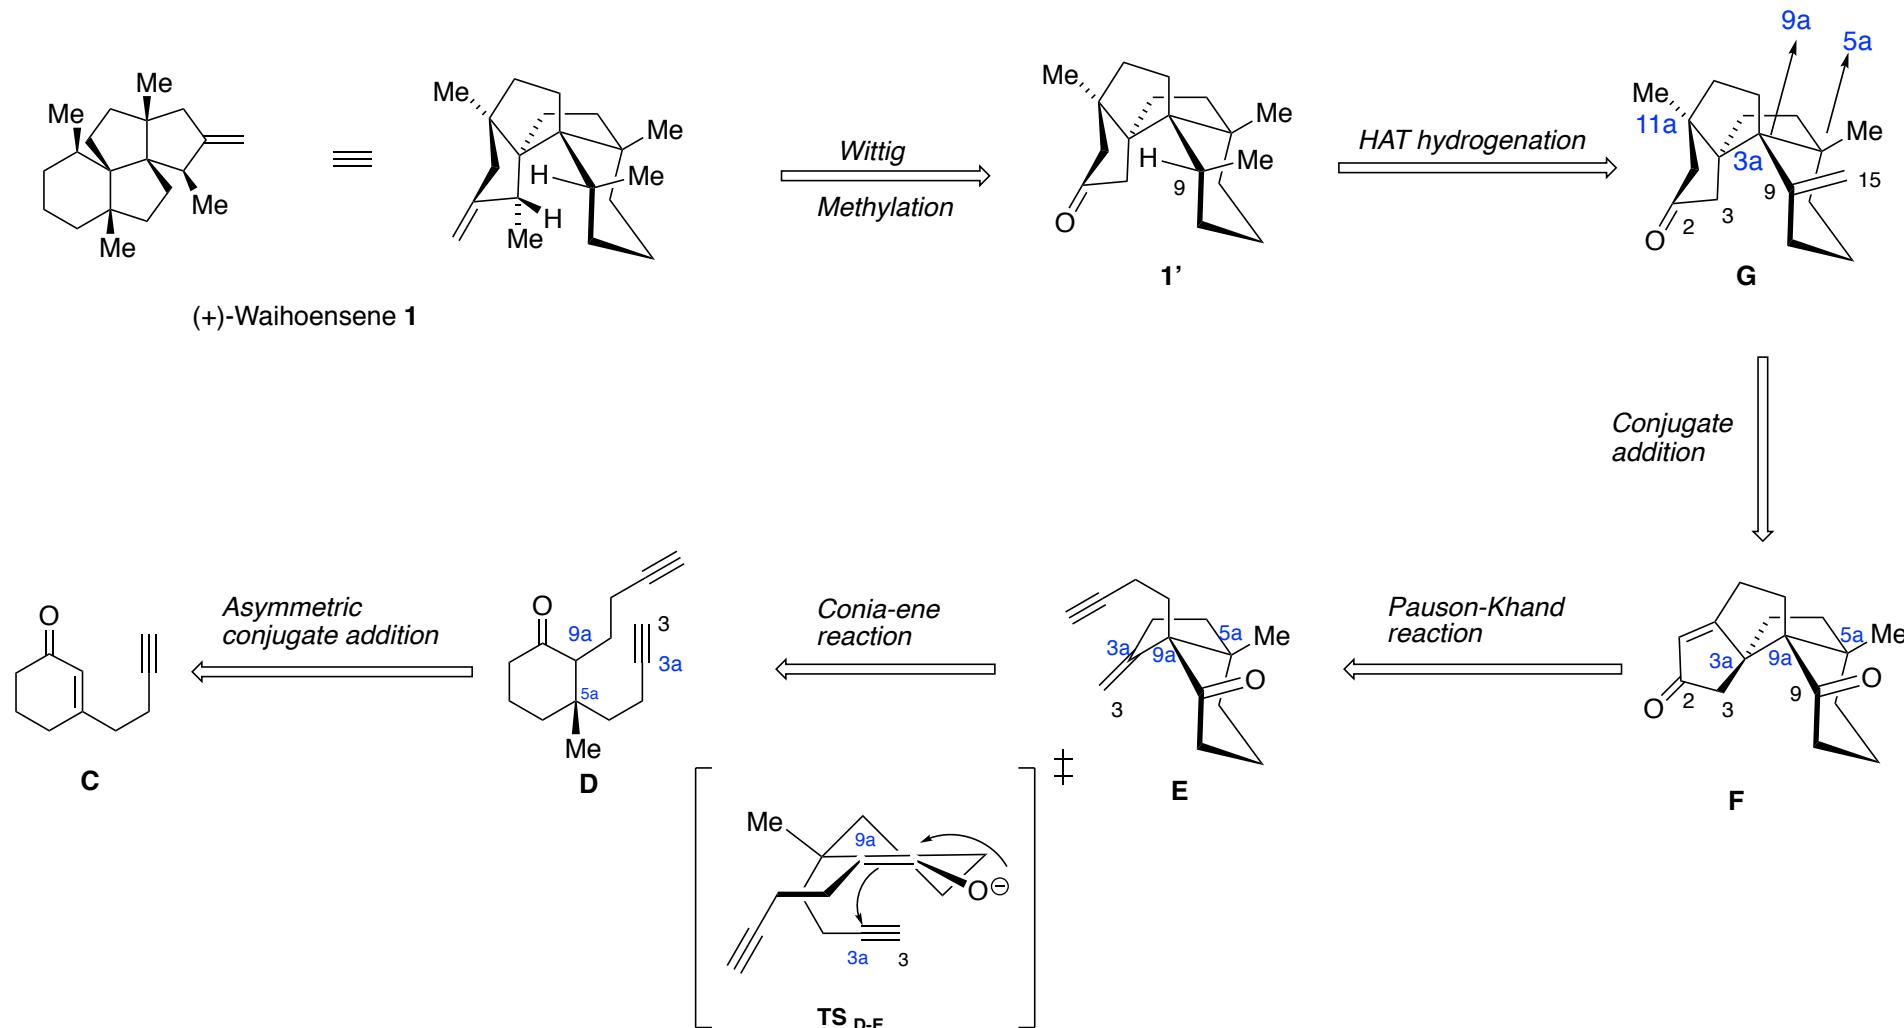

(+)-Waihoensene was isolated from the New Zealand podocarp in 1997. It is a tetracyclic diterpene containing an angular triquinane.

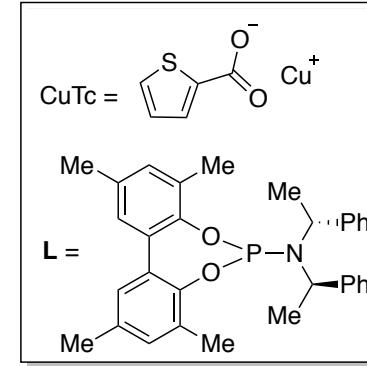

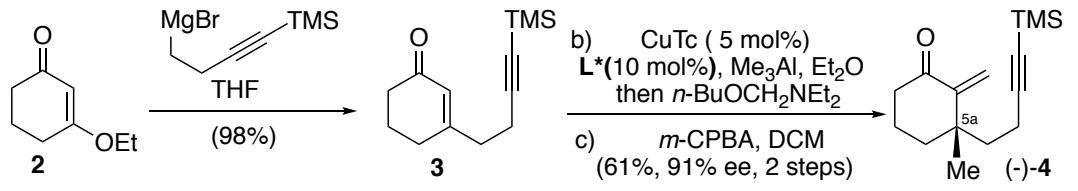

The whole structure contains a highly congested and *cis*-fused tetracyclic core decorated with 6 contiguous stereogenic centers, 4 of them are contiguous quaternary carbon.

First total synthesis of Waihoensene was achieved by Lee and co-workers in 2017 in 18 steps, featuring a tandem [2+3] cycloaddition to construct BCD ring.

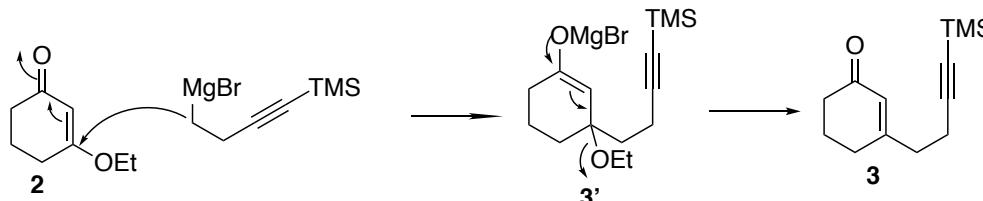

Here, they achieved the asymmetric total synthesis with 15 steps and 3.8% overall yield.

Retro-synthetic Analysis

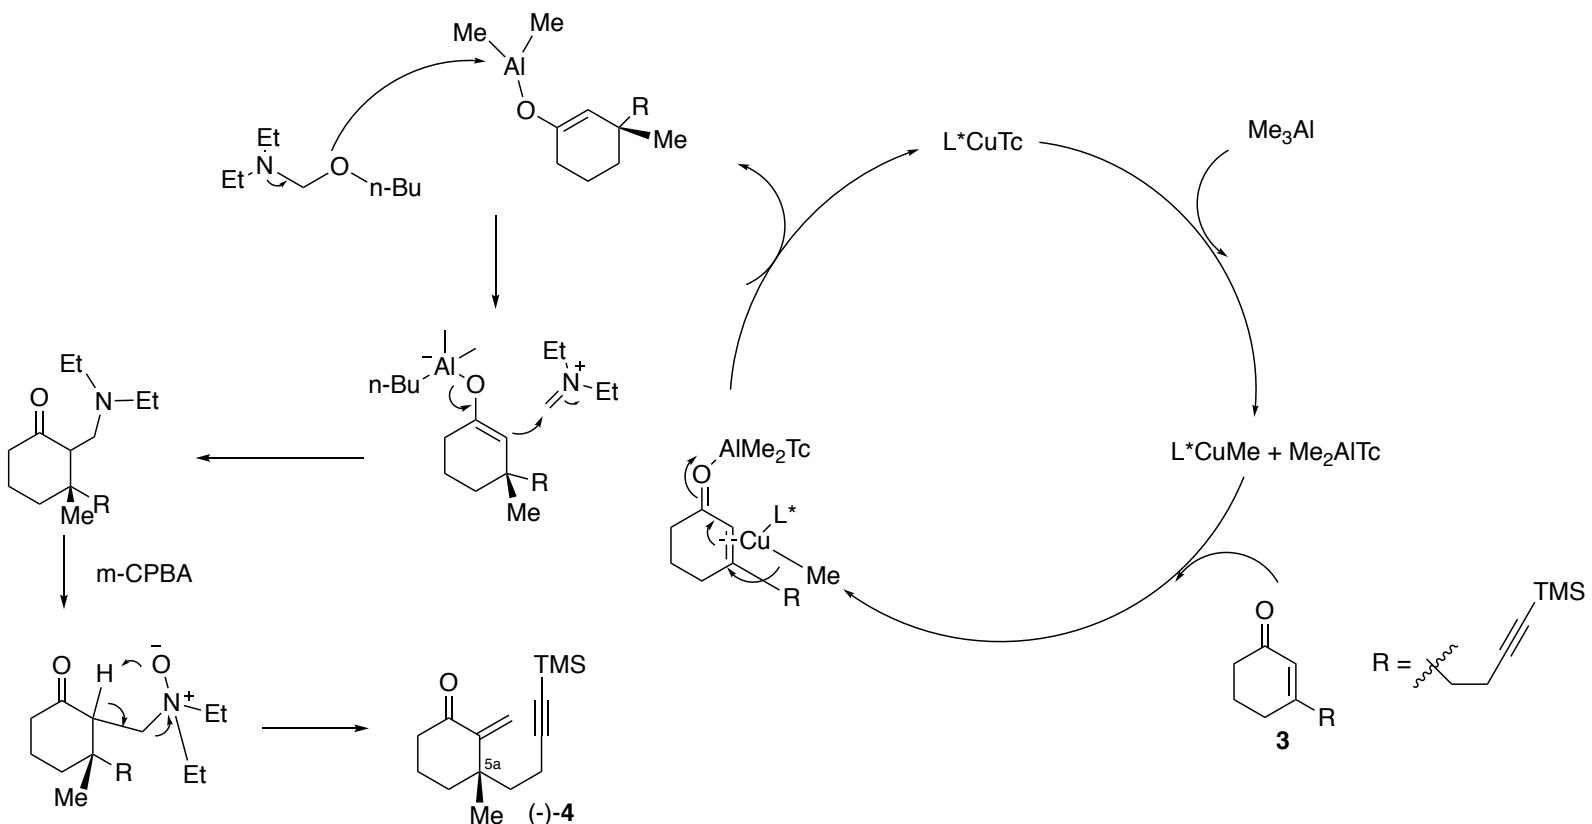

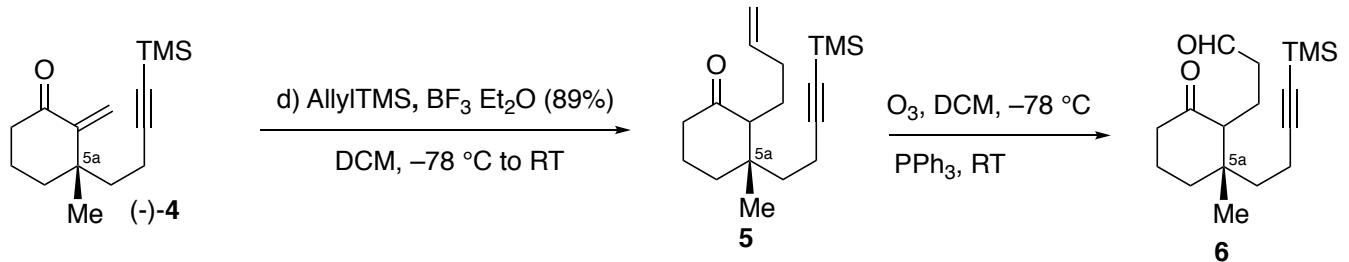

Grignard Nucleophilic addition:

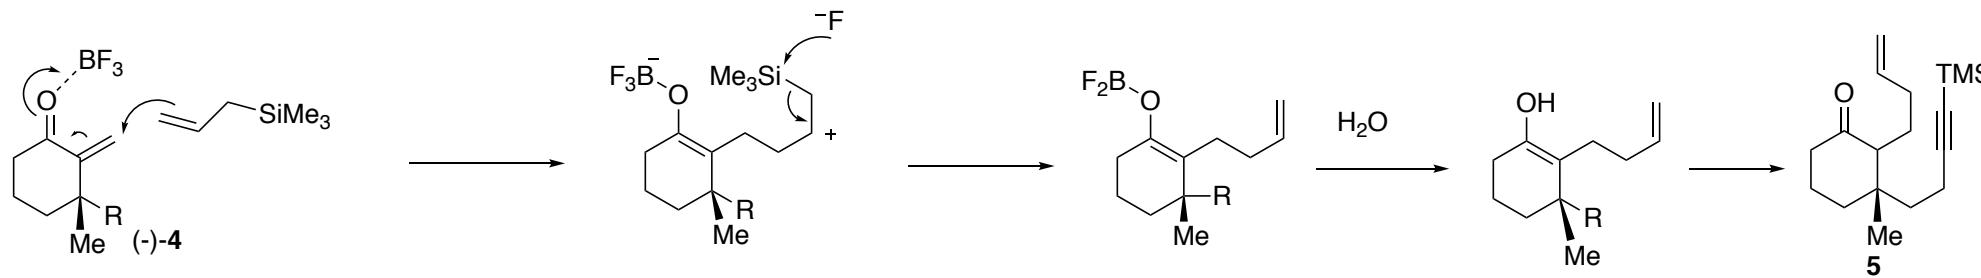

Asymmetric conjugate addition/ Enolate trapping/ Cope elimination

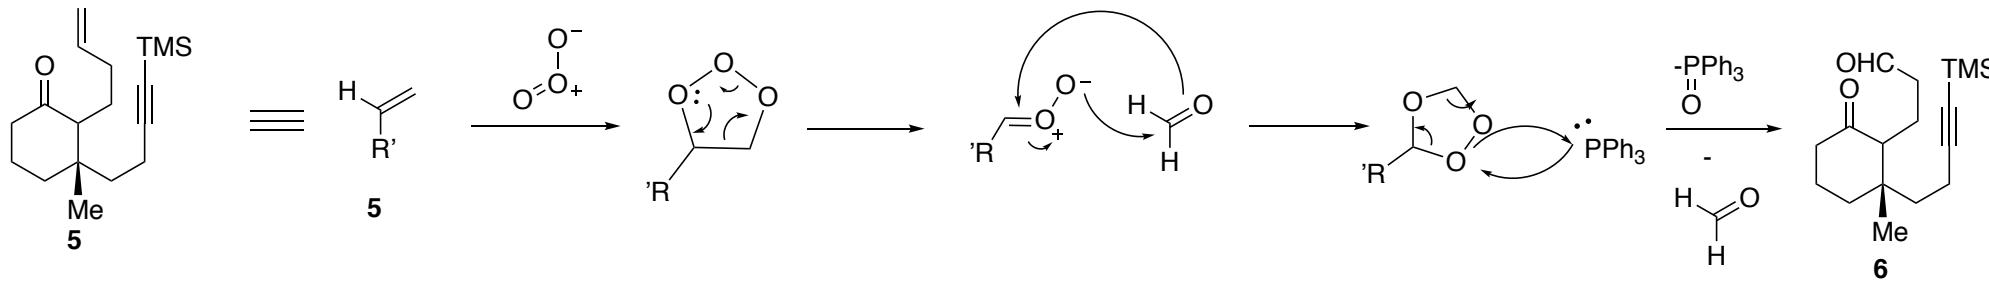

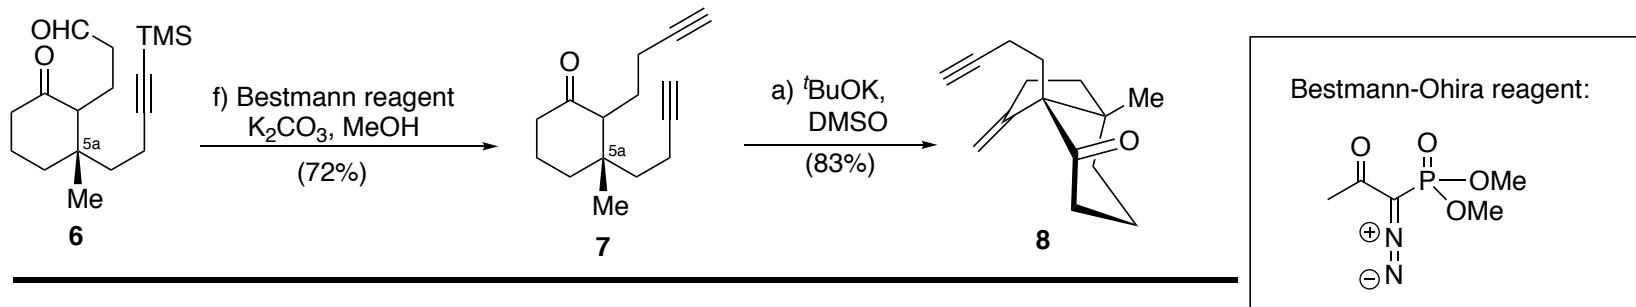

Sakurai Reaction

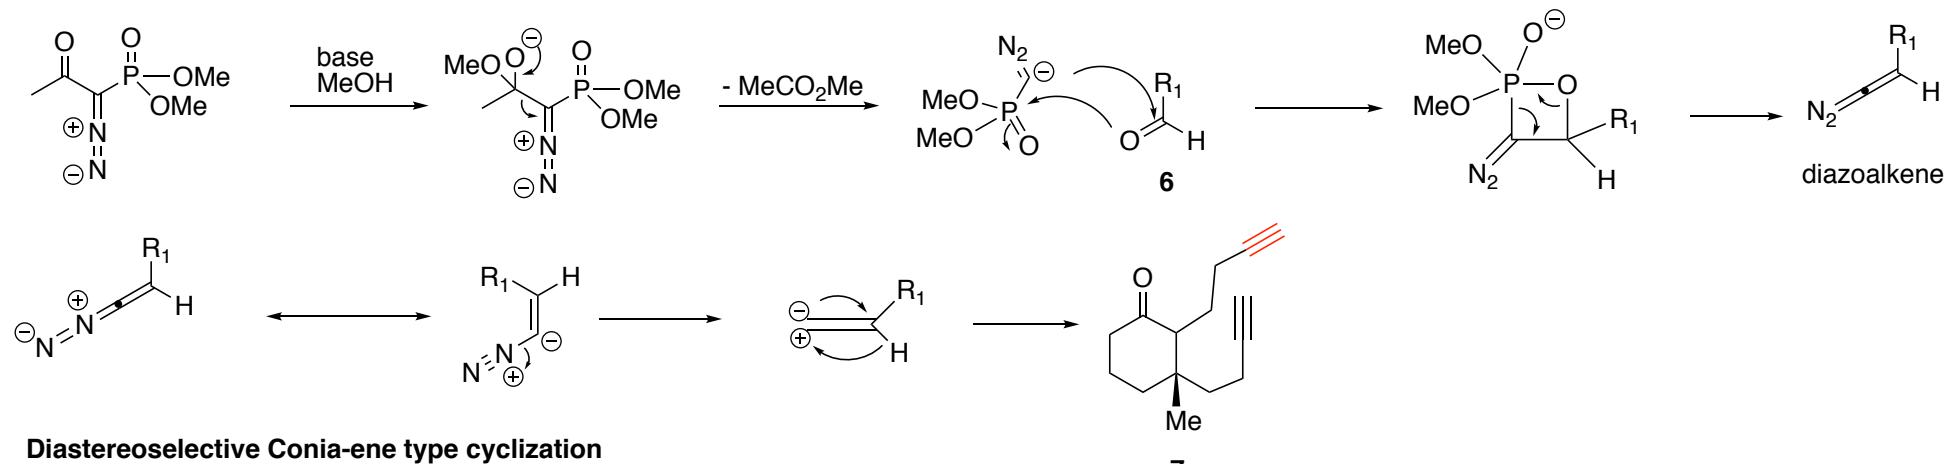

Ozonolysis

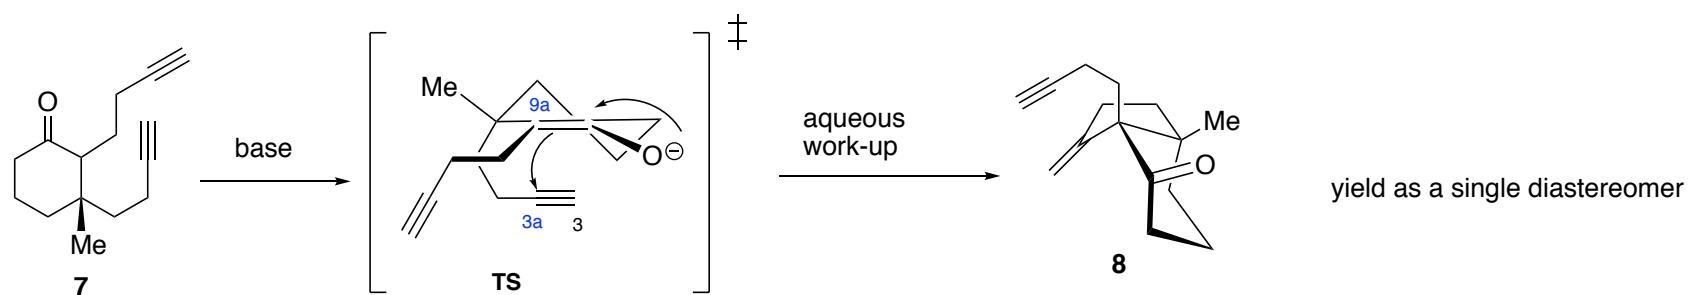

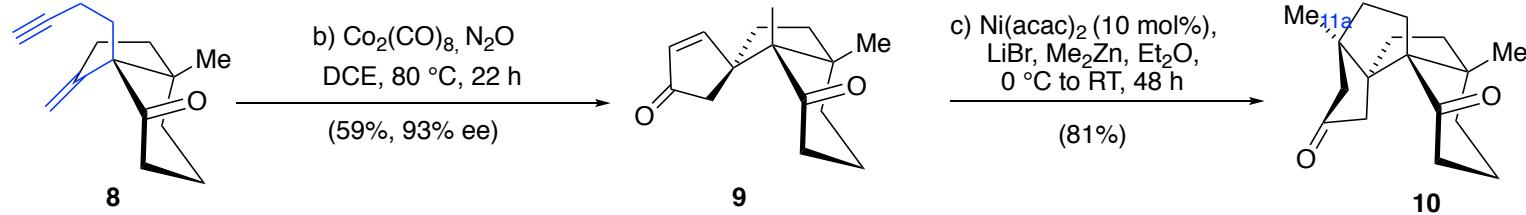

Forming diyne 7 and *in situ* desilylation

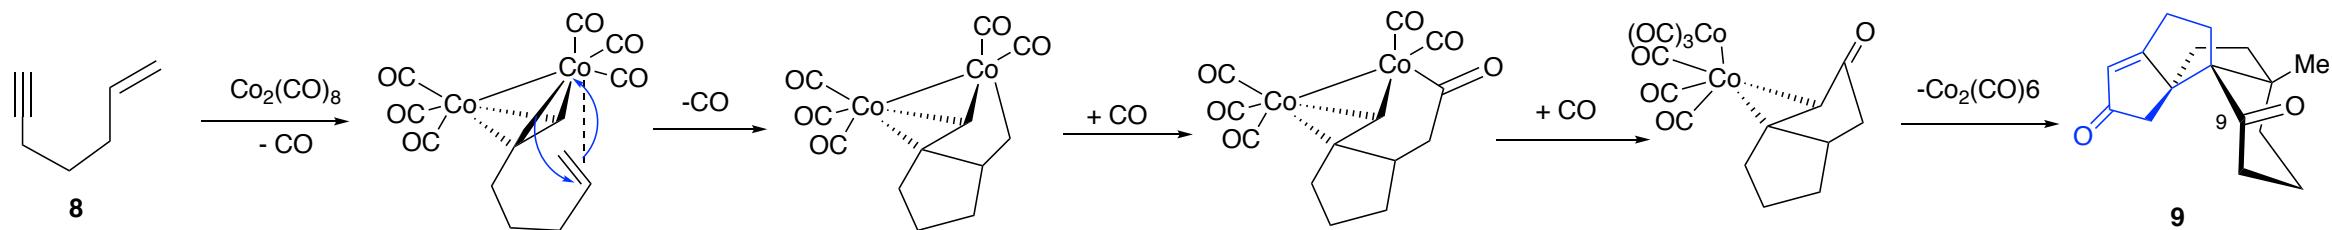

Diastereoselective Conia-ene type cyclization

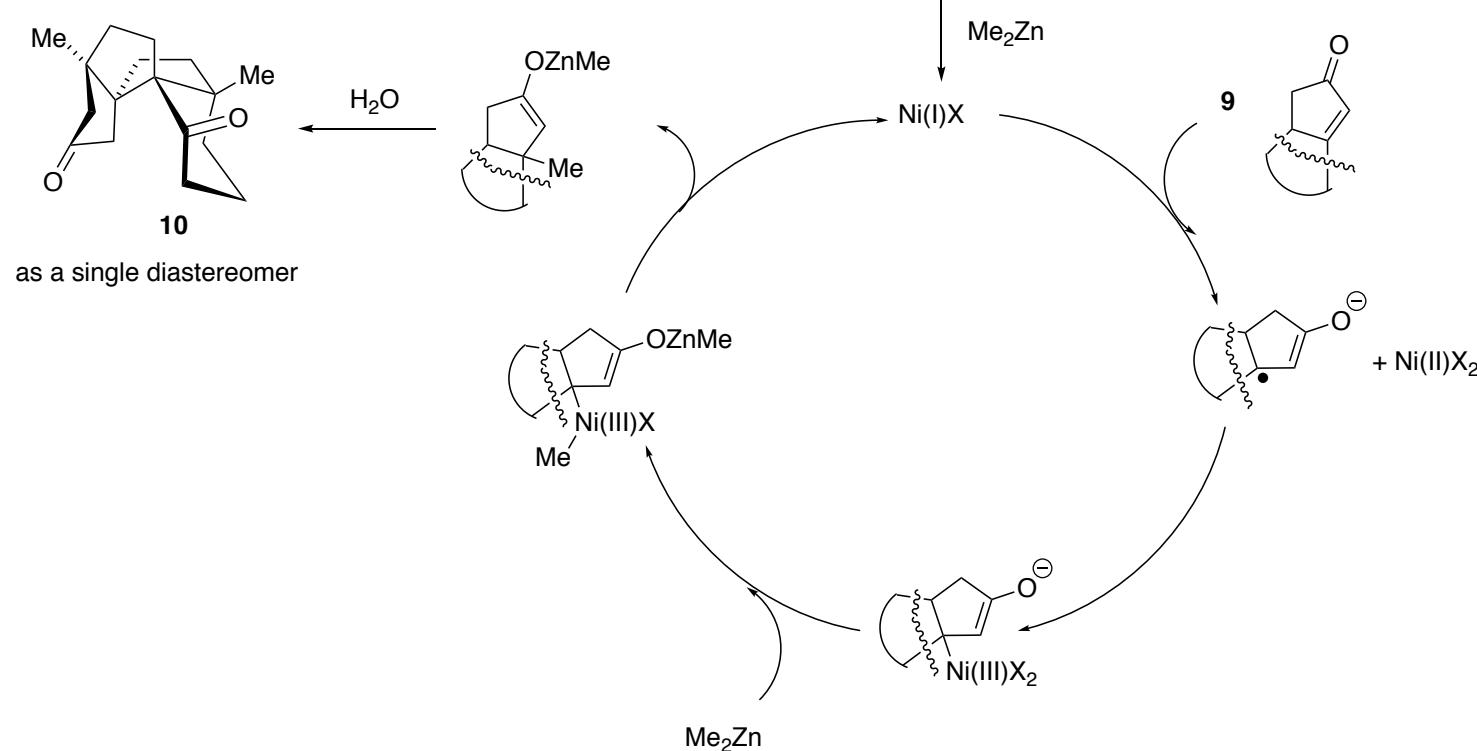

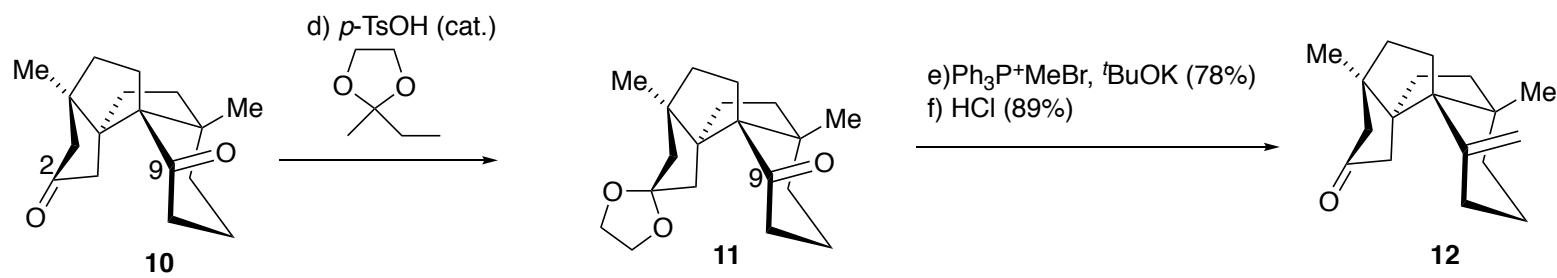

Pauson-Khand reaction

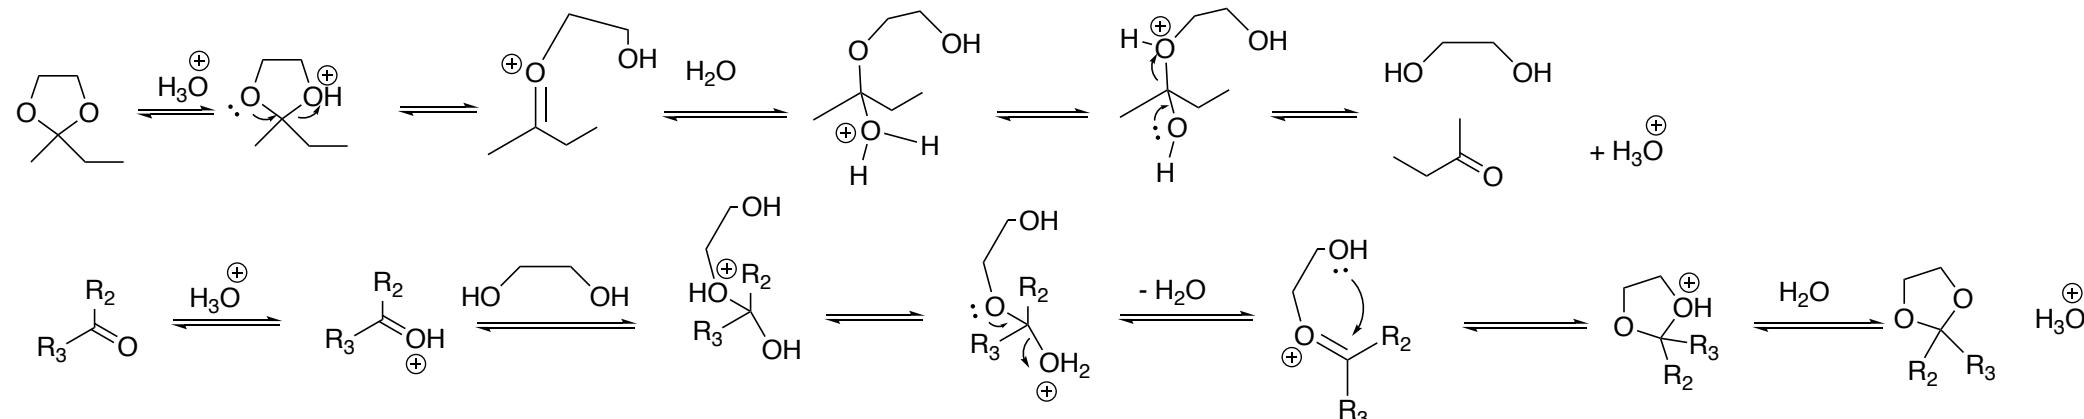

Nickel catalyzed conjugate addition of organozinc reagents

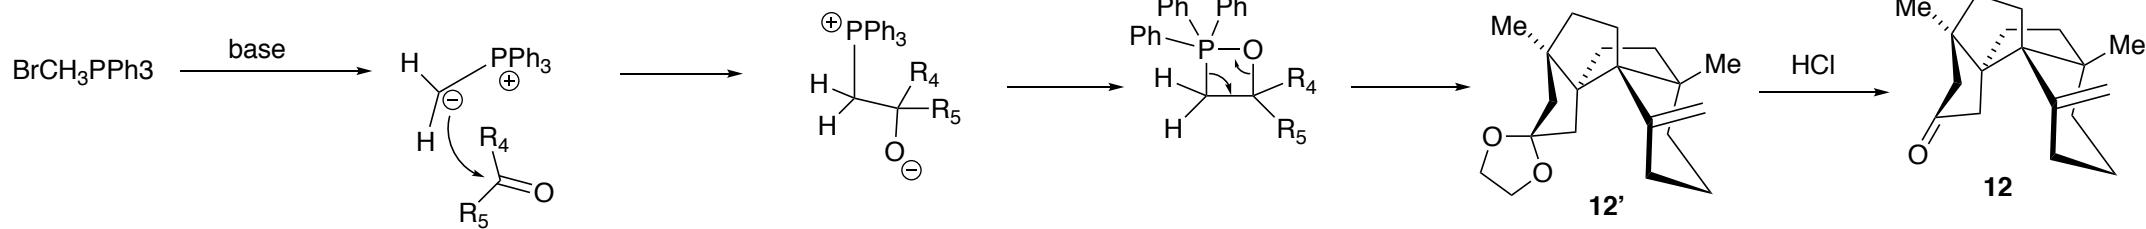

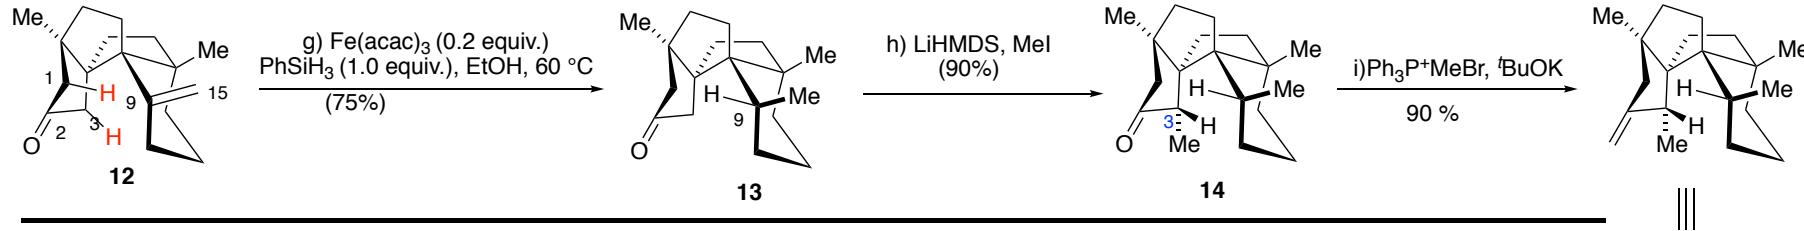

Ketal Formation

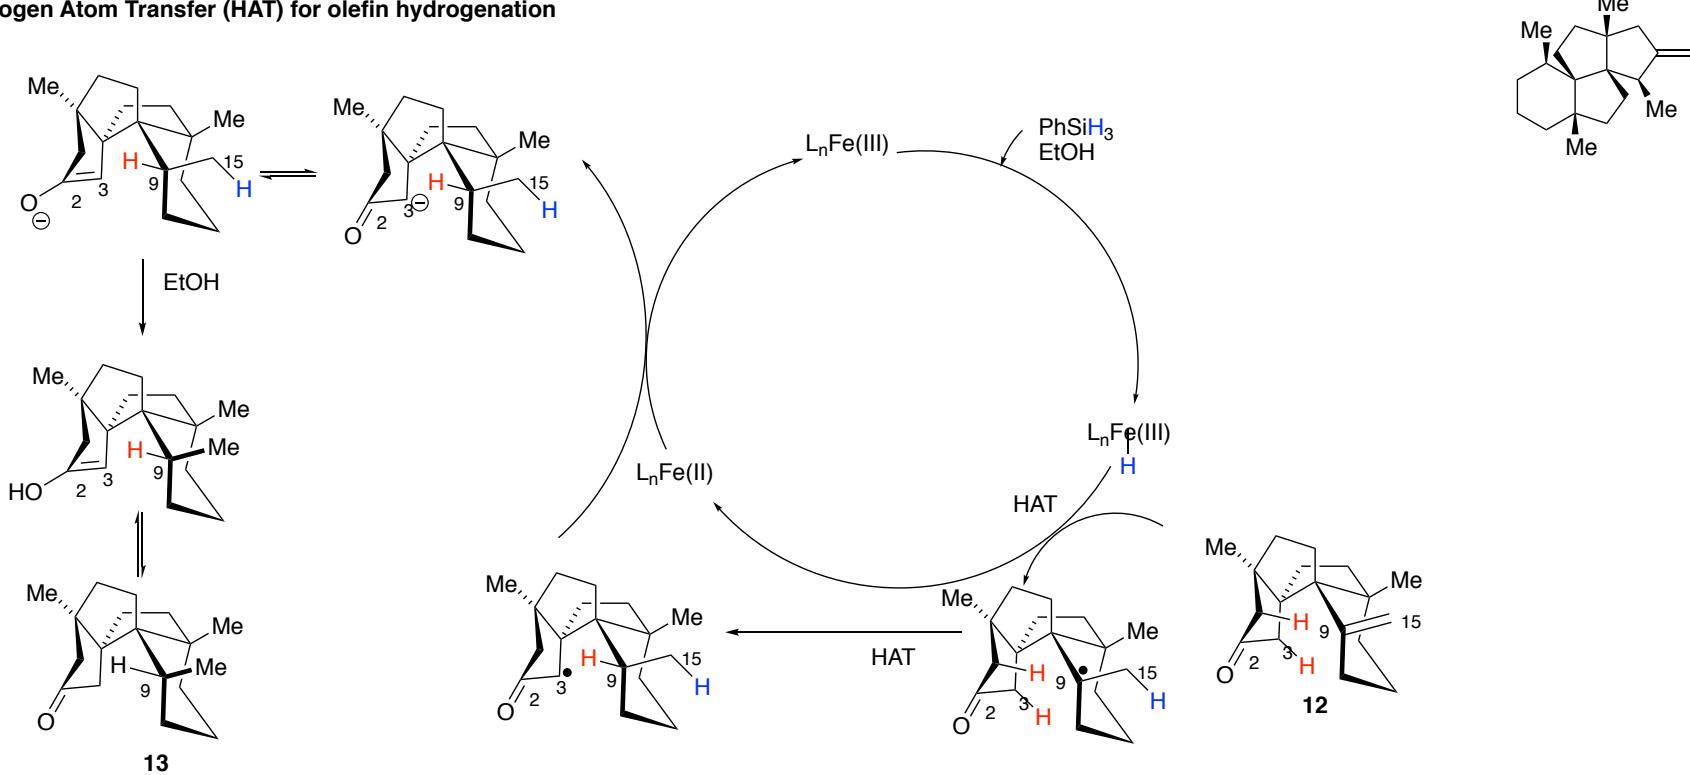

Wittig reaction and ketal deprotection

Hydrogen Atom Transfer (HAT) for olefin hydrogenation

C3 methylation and another Wittig reaction
